YaraBela™
AXAN

The larger, heavier granules in Axan result in:

- Even spreading over wider bout widths (up to 54m)
- Reduced application costs with fewer passes
- Higher tolerance to wind
- Minimal dust

YaraBela Axan is a true compound fertilizer containing sulphur and nitrogen in every granule for an even application and an enhanced nitrogen response with the addition of sulphur.

AXAN: Catering for Today's Progressive Farmers

50 years ago the progressive farmer was looking for a nitrogen fertilizer that spread up to 24m. Today, that same progressive farmer is reaching up to 50m with a strong fertilizer, containing nitrogen and sulphur in every granule.

A strong fertilizer is critical as not every product can spread to these distances. A dense, granular fertilizer such as **YaraBela AXAN** will be able to withstand the forces needed to reach such distances without any breakdown. Unfortunately, prills struggle to achieve these distances as they are much lighter and prone to shatter as well as being vulnerable to windy conditions.

The increasing requirement for sulphur comes from the reduction in atmospheric deposition and resulting low levels of sulphur in our soil. A straight nitrogen fertilizer is no longer sufficient to achieve higher yields without the addition of sulphur.

Sulphur is prone to leaching and also required by the crop throughout the growing season, therefore Yara advise a little and often approach to sulphur application.

YaraBela AXAN is a product designed for today's progressive farmer working at wider bout widths whilst also taking care of all your sulphur requirements.
